## 1. Organization Summary

To organize my course site, I created folders that reflected the different menus on my page. The top level folder contains the html file, the css file, a folder for module documents, a folder for project documents, and a folder for design elements. The module folder has either pdfs for each module or a folder with additional documents inside of it. The project folder has the zip file for my design comps and can house additional files later. My design folder hold my header image and can be used for additional files later. This keeps the initial opening of the folder clean and keeps it organized. I went through and updated all of my links to reflect these changes.

For my portfolio, I have a folder for all of my top level navigation options outline in module 4: home, portfolio, blog, and resume. These are only used for images and pdfs. The overall folder holds all four html files and the css file with these folders. The home folder holds the connect images, the header image, and my headshot even though they are consistent throughout the entire website. For this small of a website, there wasn't much need to organize all of the files, but it will help for expansion in the future.
